

Range of Motion Knee Orthosis

The range of motion knee orthosis has metal joints and extends from the thigh to the calf. It is designed to provide side to side support of the knee and can be adjusted to limit bending of the knee.

Indications:

- Progressive rehabilitation.
- Total knee, meniscus repair, tendon/ligament surgeries, fractures, dislocations, tendon releases, spinal cord injuries, hemophilia, head trauma, rheumatoid arthritis, joint arthroplasties, cerebral palsy, and multiple sclerosis.
